

Rock solid protection, 24 x 7 around the world, around the web

Introducing the SonicWALL range of gateway security devices

SonicWALL's family of Internet security appliances provide the first line of defence against Internet security threats. They include an industry certified deep packet inspection firewall, a secure Virtual Private Network facility for remote access, address management features and support for SonicWALL value-added security services.

What is a firewall ? A firewall could be defined as a device located at the internet gateway designed to prevent unauthorised access to or from a private network. All data packets passing through the internet gateway are examined by the firewall, those that do not meet pre-specified security criteria are blocked.

SonicWALL have a complete product range to suit literally any size of user base or organisation, entry level firewall products such as the TZ150 and TZ170 are perfectly suited to remote workers, branch offices or small businesses. At the higher end of the model range the SonicWALL Pro firewall series (Pro 2040, 3060, 4060 and 5060) is ideally equipped to meet the needs of corporate organisations where scalable and multi-site solutions are required.

Even within the TZ150/TZ170 entry-level product range, security based add-on services can provide gateway anti-virus checking, intrusion prevention services and anti-spam and anti-spy ware protection. For companies deploying multiple SonicWALL firewalls at geographically dispersed locations or on a global scale, SonicWALL have introduced the *Global Management System* application which allows security devices to be managed from a single centralised point.

Some of the many features and benefits of SonicWALL security devices are as follows :-

- Impenetrable security for both the wired and wireless networks through a single security platform – provides greater uptime for the network and users
- High-performance, deep packet inspection firewall with powerful encrypted Virtual Private Network throughput – enables remote users to securely link into network applications
- Sonic enhanced operating system which provides the configuration of the additional on-board port to become a secure De-militarised Zone for public access web servers
- The Sonic enhanced operating system also provides internet fail-over and load balancing on specific models – greater resilience and performance for user base
- Add-on value for money services such as gateway virus checking and intrusion prevention services – multiple services on a single platform for easy administration
- SonicWALL *Viewpoint* reporting tool for user statistics and *Global Management System* for a single centralised management point of multiple devices.
